

PROBLEM STATEMENT NO 2- *GlowCare Shampoo: Declining Market Share*

Prepare by: KEERTHIKA S (611225631051)

Course: MBA (Finance & Business Analytics)

Mapped CO2: Identify the types of data and data sources used in Data Visualization

1. Business Problem Identification:

GlowCare Shampoo is a well-known FMCG product with good distribution and consistent product quality. However, the brand has recently been facing a reduction in its market share. The marketing team believes that several factors may be responsible for this change, including customer preferences, brand image, pricing, product availability, promotional activities, and competition. At present, management does not have enough organized information to identify which of these factors is having the greatest effect. The main issue is therefore the lack of proper information about customers, competitors, and current market conditions. Collecting and analysing this information can help the company understand the reasons behind the fall in market share.

2. Classification of Data Required:

To study the reasons for the decline in GlowCare's market share, different types of data need to be collected. Both numerical information and customer opinions will be useful for the analysis.

Data Type	Examples Relevant to GlowCare
Quantitative (Structured)	Sales volume by region and retailer, market share, product prices, promotional expenses, product availability, and stock-out rates
Qualitative (Structured)	Customer ratings for brand perception, satisfaction levels, and the factors considered when choosing a shampoo
Qualitative (Unstructured)	Written customer feedback, social media comments, retailer interviews, and opinions collected through focus groups
Quantitative (Unstructured)	Website and social media engagement figures and competitor price information collected from online shopping platforms

3. Internal and External Data Sources:

Information for the study can be obtained from both the company's own records and sources outside the organization.

- **Internal Sources** – Sales records, distribution information, CRM and loyalty programme data, previous promotional results, retailer and distributor stock reports, and customer complaint records.
- **External Sources** – Customer surveys, customer interviews, competitor prices and offers, retailer point-of-sale information, social media comments, online reviews, and available market research reports.

4. Stakeholders for Data Collection:

Different groups can provide useful information about the factors affecting GlowCare's market share. The main stakeholders are:

- **Customers** – Can provide information about their shampoo preferences, satisfaction, buying habits, and reasons for changing brands.

- **Retailers** – Can provide information about product availability, shelf position, customer demand, and purchasing behaviour observed in their stores.
- **Distributors** – Can give information about product supply, distribution problems, and availability in different areas.
- **Sales Executives** – Have direct knowledge of customer and retailer interactions and may also have information about competing brands and their activities.

5. Data Collection Instrument:

A customer questionnaire will be used as the main tool for collecting primary information. It will include both multiple-choice or rating questions and a few questions where customers can give their own opinions.

The questionnaire will cover the following areas:

- **Demographic Information** – Age group, gender, location, and income range.
- **Product Usage** – Current shampoo brand and how often the customer purchases shampoo.
- **Brand Perception** – Customer ratings of GlowCare's quality, fragrance, packaging, and value for money using a Likert scale.
- **Pricing** – Customer opinion about GlowCare's price compared with other shampoo brands.
- **Availability** – How easily customers can find GlowCare in their usual shops.
- **Promotions** – Awareness of recent offers and whether these offers affected their purchase decision.
- **Open-ended Question** – Reasons for using another brand or reducing the use of GlowCare.

Along with the questionnaire, available company records will also be considered. These may include three months of sales information, retailer stock details, and records of promotional activities. These records can provide actual business information to support the responses collected from customers.

6. Data Collection Plan:

Step	Activity
1	Prepare and test the customer questionnaire before distributing it.
2	Share the questionnaire with customers through direct interaction, online forms, and selected retail outlets.
3	Collect at least 20 completed responses from customers.
4	Obtain three months of available sales, stock, and promotional information from the relevant departments.
5	Collect information about competitor prices and promotional offers from retail stores and online platforms.
6	Combine and arrange the collected information so that it can be used for further analysis and visualization.

The initial target is to collect **at least 20 customer responses**. If the required company records are available, three months of sales and related data will also be collected. The planned collection period will be completed according to the project submission schedule.

7. Expected Analytical Outcomes:

The collected information can be used to understand the possible reasons for the decline in GlowCare's market share. Customer responses can be compared across different age groups, locations, and other demographic categories to

identify differences in brand preference and satisfaction. Sales information from the three-month period can also be compared with competitor promotions to see whether changes in pricing or offers may have affected sales.

Stock information from retailers can be compared with sales performance at different outlets. This can help determine whether customers are unable to purchase GlowCare because of availability problems. Customer comments and social media responses can also be reviewed to identify common concerns related to areas such as fragrance, packaging, price, or product preference.

The results from these analyses can then be presented through dashboards and visualizations. This will make it easier to understand the major factors associated with the change in market share.

8. Conclusion:

The decrease in GlowCare Shampoo's market share may be influenced by several factors, even though the product quality and distribution network have remained consistent. To understand the situation more clearly, the company needs information from customers as well as internal business records. Data related to sales, stock availability, promotions, customer opinions, pricing, and competitor activities can provide a broader view of the problem.

By combining primary data collected through customer surveys with available secondary and internal data, GlowCare can identify the factors that may be affecting its market position. The findings can then be used to create suitable dashboards and carry out further analysis, which can support future marketing and business decisions.
